Design

The goal of our visualization is to understand when and where accidents happen. There is a large amount of data cases in the "Incident" category, but the data does not explain the nature of any of the incidences, so this visualization focuses on non-fatal and fatal accidents. This exclusion avoids obscuring the meaningful data with an overflow of uninjured passenger statistics from potentially insignificant events categorized as incidents in the records.

The first visualization provides the user control over the other visualizations. Instead of a dropdown or text entry, this interface makes selected or unselected states visually obvious. The second and third visualizations ask the questions "During what phase of flight do they occur," and "Where do accidents occur," respectively. Our goal was to allow users of various knowledge levels to discover information. Those with only surface knowledge of flight may be interested in just seeing which states or phases spike in accidents or exploring the likelihood of injury. Users with in-depth knowledge, perhaps working in aviation, may wish to look across the state and phase visualizations to look for correlations that indicate problems. They may see that a certain state or phase has high accident or fatality rates; this visualization therefore allows users to ask "why," and indicates where they should go and investigate further.

User Interface

State selection:

Select States

View Injuries by Phase

View Injuries by State

Alaska	Alabama	Arkansas	Arizona	California	Colorado	Connecticut
District of Columbia	Delaware	Florida	Georgia	Guam	Hawaii	Iowa
Idaho	Illinois	Indiana	Kansas	Kentucky	Louisiana	Massachusetts
Maryland	Maine	Michigan	Minnesota	Missouri	Mississippi	Montana
North Carolina	North Dakota	Nebraska	New Hampshire	New Jersey	New Mexico	Nevada
New York	Ohio	Oklahoma	Oregon	Pennsylvania	Rhode Island	South Carolina
South Dakota	Tennessee	Texas	Utah	Virginia	Vermont	Washington
Wisconsin	West Virginia	Wyoming	Add All	Remove All		

States are highlighted blue if selected. Only states that are selected will be included in the corresponding views.

Injuries by phase of flight. A specific stage's details are displayed beside the graph upon mouseover or click.

Injuries by state of flight. A specific state's details are displayed beside the graph upon mouseover. This is the true scale of all of the states.

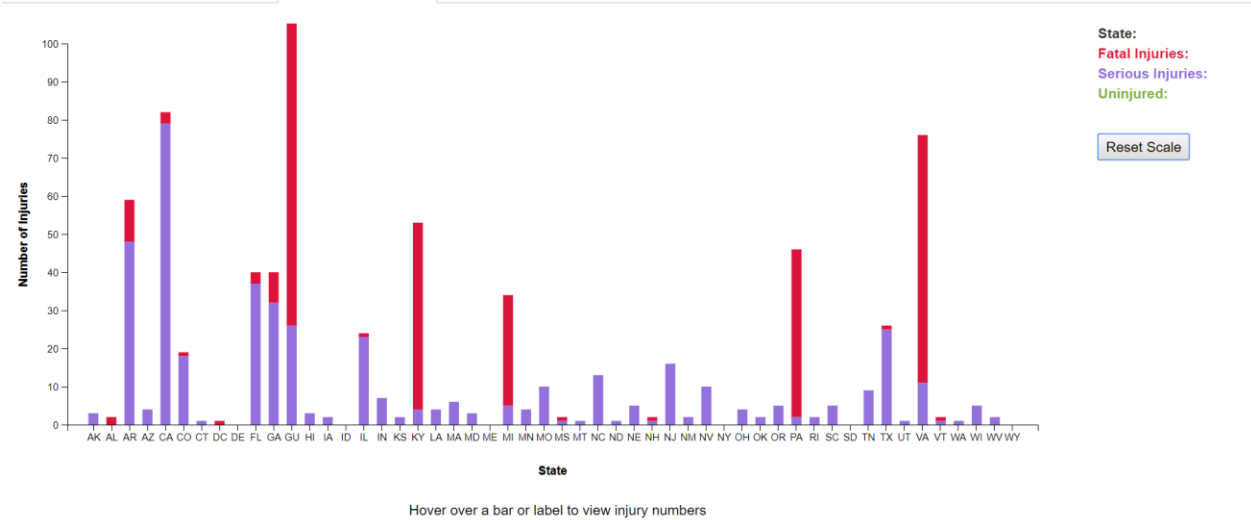

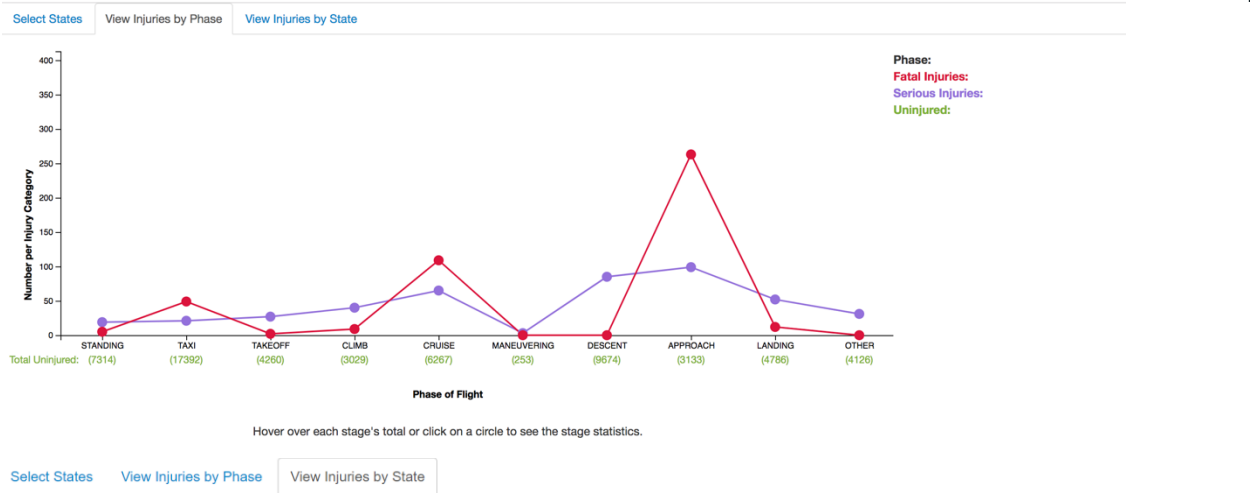

Injuries by state of flight. A specific state's details are displayed beside the graph upon mouseover. This is if the user zooms the scale in.

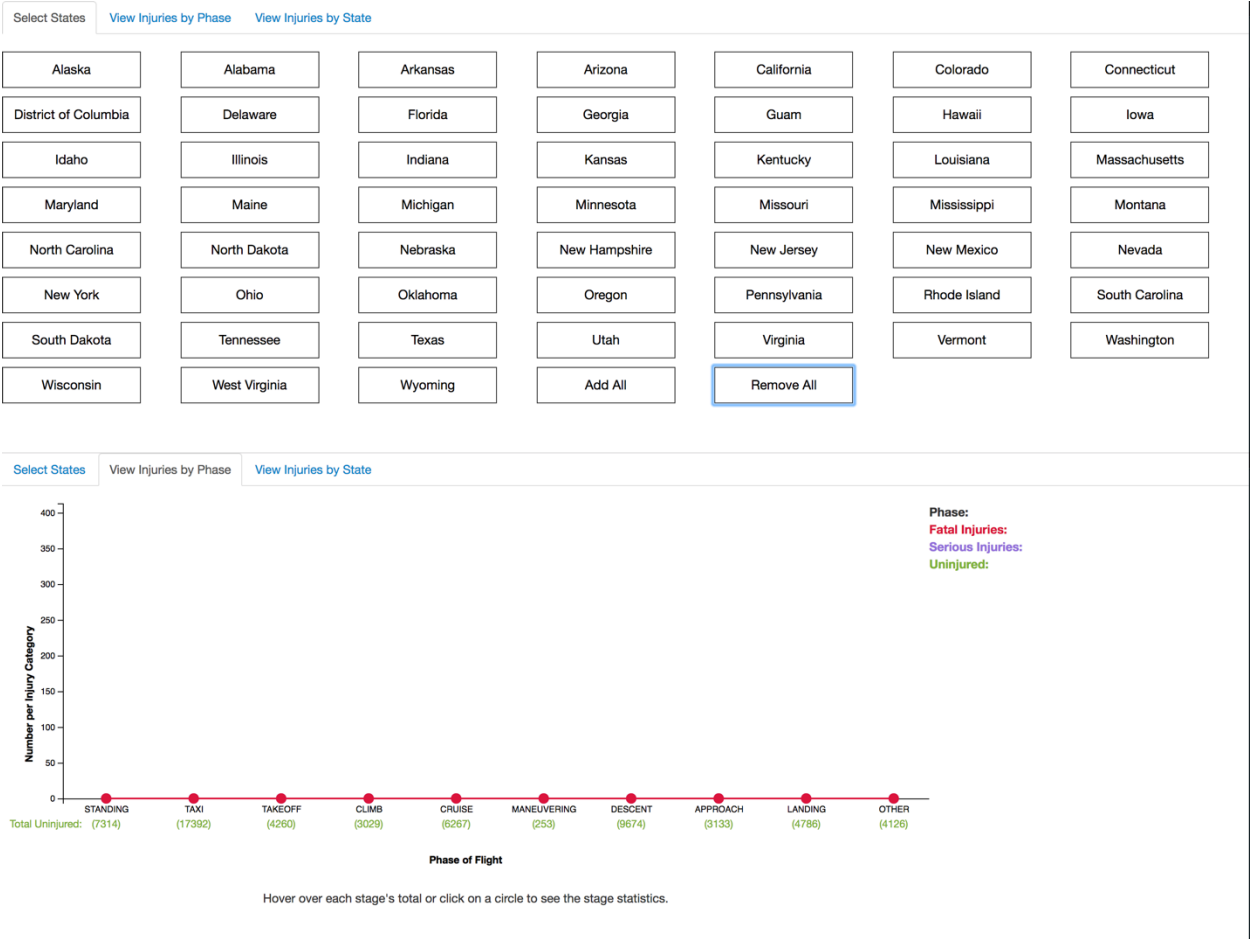

Scenario: Select all states except New York

Scenario: All states deselected.

Visualization Details

Although data for all three categories of passenger injury – uninjured, injured, and fatal – the graphs display only injured and fatal because the number of uninjured passengers is so large that it would ruin the graph scale, making the other categories' values appear to be zero. We chose therefore to represent the uninjured numbers in the details of specific data cases.

Data from New York also presented a scaling problem. The injuries in New York number in the hundreds, while most other states are less than one hundred. To resolve this issue, the initial bar graph is presented using the true scale, but the user can choose to change the scale to zoom in. This makes the bars for other states much larger and easier to compare to one another.
